Hydrasalinol: extracted from Salicornia herbacea

Hydrasalinol is an oily extract obtained by CO2 subcritical extraction of Salicornia herbacea

Salicornia, from the Arabic etymology "salcoran", takes its name from its shape: the successive bulges which it is constituted, end with a prominent nipple called "Horn of salt".

Salicornia is a genus of succulent, halophyte (salt tolerant) plants that grow in salt marshes, on beaches, and among mangroves.

Common names for the genus include glasswort, pickleweed, and marsh samphire; these common names are also used for some species not in *Salicornia*.

CONCLUSION

Discovery of Aquaporin 8 and introduction of a new concept: TEUL

- Increase in the expression of AQP8 and AQP3 to improve urea synthesis and water storage and thus to reinforce the NMF
- Improvement of cellular cohesion
- Increase in epidermal lipids production
- Reduction in TEUL and TEWL
- Increase is skin hydration

- ***Inci name:*** *Caprylic/capric triglyceride (and) Salicornia herbacea extract*
- ***Chinese Inci name:*** *Caprylic/capric triglyceride (and) Vegetable Oil*

- ***Recommended % use: from 0.25%***
- ***Ecocert approved***
- ***Cosmos approved***
